Fast Track Agentic Automation – GenAI Activities

Building AI-Powered Workflows with Ease

Fast Track Agentic Automation

2/6 – GenAI Activities

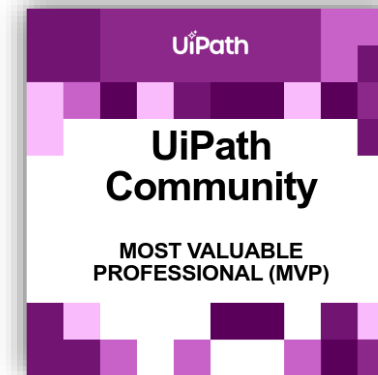

Building AI-Powered Workflows with Ease

About Me

- 🤖 RPA Solution Architect & Tech Lead
- 🏆 7X UiPath Professional Certified
- 🤖 RPA Enthusiast
- 🏆 2x UiPath MVP 2026,2025
- 🚩 Consistent contributor on UiPath Forum

Let's connect!

The Shift to Intelligent Automation

Traditional RPA

["The Hands"]

A technology that uses virtual "bots" to automate repetitive, rules-based, high-volume tasks by mimicking human actions like clicking, typing, and opening applications.

Generative AI

["The Brain"]

A type of artificial intelligence that creates new, original content including text, images, music, and code by learning patterns from massive datasets using neural networks.

Intelligent Automation

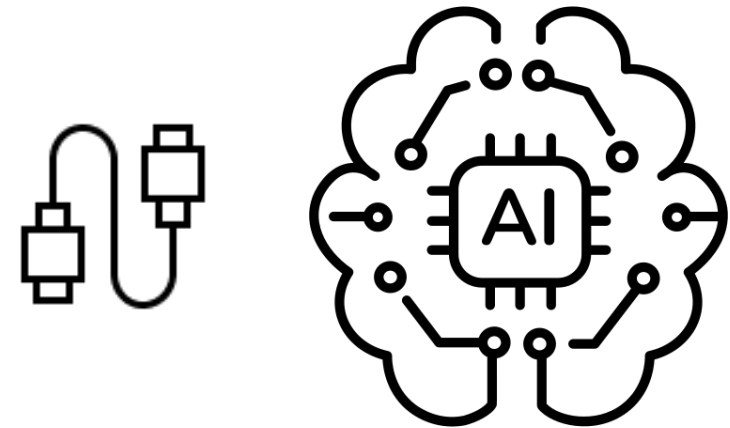

["IA"]

Combining Traditional Robotic Process Automation (RPA) with Generative AI (GenAI) transforms rigid, rule-based automation into Intelligent Automation (IA). GenAI activities allows developers to embed LLM (Large Language Model) capabilities directly into their workflows without complex API coding.

What are UiPath GenAI Activities?

GenAI Activities

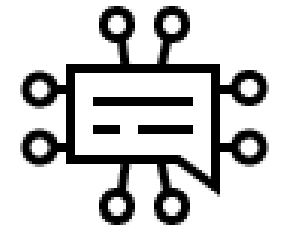

- ✓ A suite of pre-built activities within the Integration Service that provides a unified interface to top AI models.
- ✓ No need to build custom integrations for every AI provider.
- ✓ Works seamlessly with **UiPath Studio** and **Studio Web**

Core Capabilities (Text & Analysis)

GenAI Activities

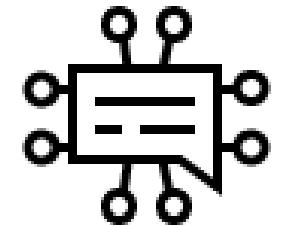

1. **Content Generation:** Generate a chat response for the provided request using chat completion models. Draft responses, reports, or creative copy.
2. **Generate Email:** Enables you to have a draft of an email composed meeting a specific style.
3. **Summarize Text :** Summarize long documents or email threads.
4. **Sentiment Analysis:** Automatically detect if a customer is happy or frustrated.
5. **Reformat:** Detect and change the format of a string of text[String, CSV, JSON, XML, YAML, HTML, Markdown].
6. **Translate:** Takes input text and a target language and outputs the translated text in the specified language.
7. **Detect Language:** Detect the language of a given text.
8. **Categorize:** Categorize content based on provided categories. Tag and route incoming data to the right department.
9. **Named Entity Recognition:** For a given text string, identify and classify named entities.
10. **Semantic Similarity:** Compare a string to another string or a list of strings using generative AI.

Advanced Features: Context Grounding & RAG

GenAI Activities

1. **Context Grounding Search:** Given a natural language input or query, retrieve similar context from Context grounding indexes or from files. You can also set this directly in the **Content Generation** activity. Use **Context Grounding Search** if you need to extract similar context from an index based on some other text input instead of the prompt itself.
2. **PII Filtering:** This activity scans the input text, identifies any Personally Identifiable Information (PII) or Protected Health Information (PHI), and replaces such data with a redaction marker.
3. **Update Context Grounding Index:** Sync latest data for existing indexes in Context grounding. The ingestion processing may take some time depending on the quantity of new data being synced. You can also accomplish this manually in the Automation Cloud Admin, in the AI Trust Layer panel.
4. **Get DeepRAG Analysis by ID:** This activity retrieves a DeepRAG-generated Context Grounding analysis using the DeepRAG analysis ID returned by an agent.

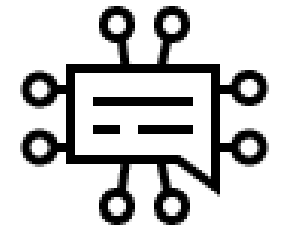

Web Capabilities: Plug automations to internet

GenAI Activities

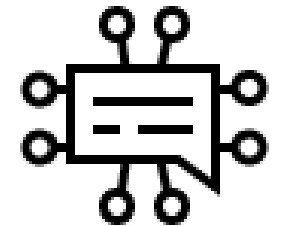

1. **Web Search:** Web Search executes a search of the public domain using a natural language search query. The search results are available in the output.
2. **Web Summary:** Web Summary provides an AI-generated summary of search results, synthesizing key insights from multiple sources and including citations. The summary and source citations are available in the output.
3. **Web Reader:** Given a publicly accessible URL, the Web Reader activity extracts the text in a format suitable for feeding to an LLM, to offer context from the public domain.

**The activities offers near-real-time search results.*

GenAI Activities

1. **Image Analysis:** Describe what is in a photo.
2. **Object Detection:** Identify specific items (e.g., "Is there a hard hat in this safety photo?")
3. **Signature Similarity:** Compare signatures for fraud detection or document verification.
4. **Image Comparison:** Compare two images for differences.
5. **Image Classification:** Classify an image using custom categories and descriptions.

“AI is only useful if it is safe and compliant.”

- ✓ **PII Filtering:** Automatically detect and mask Personal Identifiable Information (Names, SSNs, etc.) before it reaches the AI model.
- ✓ **Centralized Management:** All connections are managed through the Integration Service, providing a single audit trail.
- ✓ **Data Residency:** Options to ensure data stays within your required geographic region.

Why It Matters (The "So What?")

- ✓ **Speed to Value:** Deploy AI features in days, not months.
- ✓ **Reduced Complexity:** A single "connector" interface for multiple AI models.
- ✓ **Scale:** Empower "Citizen Developers" to use AI safely.
